It can solve up to 20 types of captcha, you can even train it to your own preferred type (also quite entertaining!) I've been using this (and NLP) in general on a daily basis for almost a year now, and I can't stress how amazing it has been. I like the idea of NLP and how it can be used to program a bot to do certain actions like perform a "purchase", but I would rather use a general solution for that purpose, something that works well, works most of the time, and probably wouldn't make the bot so easy to defeat. I'm thinking of a little utility like this one where you need to solve a captcha, and then after you have done it, the bot will start up and generate new captchas that would be harder to solve. It's a work in progress at the moment, I have quite a lot of additional logic, and it's a lot of fun doing it for fun and educational purposes too! The idea is that after you have solved the captcha, the bot will start up, and do whatever you want it to do, based on certain criteria. For example, after you have solved the captcha successfully, the bot will start generating new captchas based on a certain probability, but they will be generated so

---

that they are easier to solve than the previous ones. If the captcha is generated too fast for you to solve it, then it can ignore that captcha, and go on generating the next one in line, or it can even skip one in between. Because it's probabilistic, it means that it can generate lots of captchas, and it's not that likely that you are going to solve them all, so you can still fill out the rest on the web forms that require captcha verification. This is meant to help against internet terrorists and spammers, as well as a security measure against bots. The captcha types the bot will use are: Country flag verification (e.g. USA, CANADA) Country flag verification with mathematical transformation (e.g. USA = A+B, CANADA = A-B) Country flag verification with detection of grayscale picture with user-specified dimensions (e.g. USA = 12x13, CANADA = 9x11) I'm interested in feedback from anyone with experience with captcha solving bots (or captcha-s 82157476af
